The following were changed at the resolution center at the convention: #7 thrown out, #11 33

1. 
$$\left| \frac{-1}{9} \right|$$
 Part A: As  $x \to 1$ , we can assume that  $x > 0$ , so  $\lim_{x \to 1} \frac{|x| - x}{x - 1} = 0$ . Part B:

$$\lim_{x \to 0} \frac{\cos x - 1}{x} = \lim_{x \to 0} \frac{(\cos x - 1)(\cos x + 1)}{x(\cos x + 1)} = \lim_{x \to 0} \frac{-\sin x \cdot \sin x}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x + 1} \right) = \lim_{x \to 0} \frac{\cos x - 1}{x(1 + \cos x)} = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x} \right) = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x} \right) = \lim_{x \to 0} \left( -\sin x \cdot \frac{\sin x}{x} \cdot \frac{1}{\cos x} \right) = \lim_{x \to 0} \left( -\sin x \cdot \frac{1}{x} \cdot \frac{1}{\cos x} \cdot \frac{1}{x} \cdot \frac{1}{\cos x} \right) = \lim_{x \to 0} \left( -\sin x \cdot \frac{1}{x} \cdot \frac{1}{x} \cdot \frac{1}{\cos x} \right) = \lim_{x \to 0} \left( -\sin x \cdot \frac{1}{x} \cdot \frac$$

$$0 \cdot 1 \cdot \frac{1}{2} = 0. \text{ Part C: } \lim_{x \to 3} \frac{\left(1 / x\right) - \left(1 / 3\right)}{x - 3} = \lim_{x \to 3} \left(\frac{3 - x}{3x} \cdot \frac{1}{x - 3}\right) = \lim_{x \to 3} \frac{-1}{3x} = \frac{-1}{9}. \text{ Sum the parts.}$$

2. 4.1 Part A: 
$$(f \cdot g)^{/}(3) = f \cdot g^{/} + g \cdot f^{/} = (5)(.7) + (-4)(1.1) = -0.9$$

Part B: 
$$(g/f)'(-2) = \frac{f \cdot g' - g \cdot f'}{f^2} = \frac{(1)(5) - 0}{1^2} = 5$$
. Sum the parts.

3. 
$$-1\frac{23}{24}$$
 or  $\frac{-47}{24}$  Part A:  $f'(x) = 3x^2 - 2x - 1 = 0@x = 1$  and  $\frac{-1}{3}$ . Finding the y-values for

these and also for the endpoints shows that x = -2 yields the minimum y-value. Part B: This problem requires the relative extrema of the third derivative, so we have to find the  $4^{th}$ 

derivative  $\Rightarrow y^{(iv)} = 24x - 1 = 0 @ x = \frac{1}{24}$ . There are no values where the derivative does not

exist. Sum the parts.

4. 
$$\frac{5\pi^2}{2} \text{Part A: (Disk)} \ V = \int_0^{\pi} \pi \sin^2 x dx = \frac{\pi^2}{2}. \text{ Part B: (Shell)} \ V = \int_0^{\pi} 2\pi x \sin x dx = 2\pi^2. \text{ Sum}$$

the parts.

- 5. DCAB
- 6.  $\boxed{\frac{1}{3}}$  Part A: Not moving means  $v = 0 \Rightarrow v = 6t 2 = 0 @ x = \frac{1}{3}$ . Part B: Changing direction means v-changes sign  $\Rightarrow v = 3(2t 3)^2(2)$  and is positive for all values of t. So, the particle

never changes direction, or zero times. Sum the parts.

7.  $\boxed{4}$  Part A diverges by the  $n^{th}$  term test, so subtract 5. Part B converges by the integral test, so add 3. Part C converges by the comparison test with a geometric series, so add 3. Part D converges by the Ratio Test, so add 3. Sum the parts.

The following were changed at the resolution center at the convention: #7 thrown out, #11 33

8. 
$$\left| \frac{8 + 75\sqrt{5}}{50} \right|$$
 Part A:  $\tan \theta = \frac{h}{40} \Rightarrow \frac{d\theta}{dt} = \frac{1}{40} \cos^2 \theta \frac{dh}{dt} \Big|_{h=30} = \frac{1}{40} \left( \frac{4}{5} \right)^2 (10) = \frac{4}{25}$ . Part B:

We need to find  $\frac{ds}{dt}$  when x=1, y=2 and  $\frac{dx}{dt}=\frac{3}{2}$ .

So, 
$$s^2 = x^2 + y^2 = x^2 + (x^2 + 1)^2 \Rightarrow \frac{ds}{dt} = \frac{3x + 2x^3}{s} \cdot \frac{dx}{dt} \Big|_{x=1} = \frac{3\sqrt{5}}{2}$$
. Sum the parts.

9. Part A: Change (so we can use L"Hopital's) to  $\lim_{x\to\infty}\frac{\sqrt{x}}{e^x}=\lim_{x\to\infty}\frac{(1/2\sqrt{x})}{e^x}=\lim_{x\to\infty}\frac{1}{2e^x\sqrt{x}}=0.$ 

Part B: Let

$$y = \lim_{x \to \infty} (x - 1)^{\frac{1}{x}} \Rightarrow \ln y = \lim_{x \to \infty} \left[ \frac{1}{x} \ln(x - 1) \right] = \lim_{x \to \infty} \frac{(1/x - 1)}{1} \text{ (by L''Hopital's)}. \text{ Therefore,}$$

 $\ln y = \lim_{x \to \infty} \frac{1}{x-1} = 0$  and  $y = e^0 = 1$ . Sum the parts.

10.  $\left| \frac{1}{24} \right|$  Part A:

$$f(x) = \frac{e^{x} - e^{\frac{x}{2}}}{2} \Rightarrow f'(x) = \frac{1}{4} \left( 2e^{x} - e^{\frac{x}{2}} \right) \Rightarrow f''(x) = \frac{1}{8} \left( 4e^{x} - e^{\frac{x}{2}} \right) \Big|_{x=0} = \frac{3}{8}.$$
 Part B:

$$\frac{dx}{dt} = 3t^2 \& \frac{dy}{dt} = 2t \Rightarrow \frac{dy}{dx} = \frac{2}{3t} \Rightarrow \frac{d^2y}{dx^2} = \frac{(3t) \cdot 0 - 2 \cdot \left(3 \cdot \frac{dt}{dx}\right)}{6t^2} = \frac{(-6/3t^2)}{6t^2} = \frac{-1}{3t^4}\Big|_{t=1} = \frac{-1}{3}.$$

Sum the parts.

- 11. 31 Part A: The rectangle areas sum to  $[2 \cdot f(1) + 2 \cdot f(2) + 2 \cdot f(3)] = 2 + 4 + 20 = 26$ . Part B: Only 2 rectangles can be inscribed, the others have a height of zero. So the sum of the areas of those 2 rectangles is  $[1 \cdot f(1) + 1 \cdot f(2)] = 4 + 1 = 5$ . Sum the parts.
- 12. 5 Part A: Set  $x'(t) = -4\cos t = 0 \Rightarrow t = \frac{\pi}{2}, \frac{3\pi}{2} \Rightarrow x = -1, 7$ . Part B: Use implicit differentiation to get  $\frac{dy}{dx} = \frac{2x+1}{2y}$ . The tangent is vertical when y = 0, hence x = -2, 1. Sum the parts.
- 13. III only Statements I and II are both always true by the Extreme Value Theorem. Statement III is false. Consider  $y = x^2$  on [1,4]. Then  $f'(c) \neq 0$  for 1 < c < 4.

The following were changed at the resolution center at the convention: #7 thrown out, #11 33

- 14. 10 Part A: The 3<sup>rd</sup> derivative at x = 3 is found in the 4<sup>th</sup> term. It is the coefficient of  $\frac{(x-3)^3}{3!}$ .
  - So,  $f^{\prime\prime\prime}(3) = 7$ . Part B: the 4<sup>th</sup> derivative is part of the coefficient of the 4<sup>th</sup> degree term.

$$\frac{f^{(4)}(0)}{4!}x^4 = \frac{x^4}{(2)(4)} \Rightarrow f^{(4)}(0) = \frac{4!}{8} = 3. \text{ Sum the parts.}$$
